INSTRUCTIONS

- Use Font size 22 to 28 and Font Style Times New Roman (body)
- Do not change the Template: Heading / Title of the slides
- Do not change font style or colours
- Do not copy paste paragraphs: use only Bullet Points
- Maximum slide Limit is 20 only
- As per the number of supervisor allotted adopt slide-2 or slide-3
- Please display the required meaningful Content or images or tables
- Change the footer accordingly using insert tab then click on header & footer tab and edit it
- Save the PPT with Register No, Dept and Review no, example: 23xxxxxxxxx_CSE

Title: FusionBite-Unified checkout for every craving

Abstract

- Multi-Restaurant Online Food Ordering System is a web-based platform.
- It allows users to browse and order food from multiple restaurants through a single website.
- The main aim of the project is to make food ordering more convenient and efficient.
- It brings different restaurants together on one platform for easy access.
- Users can view menus from various restaurants available on the website.
- Customers can select their preferred food items from different restaurants.

Existing System

- In the existing system, customers usually order food from individual restaurant websites or separate food delivery applications.
- Each restaurant maintains its own ordering platform.
- Users must visit multiple websites or apps to browse menus from different restaurants.
- Customers need to place orders separately for each restaurant.
- Most systems allow the cart to contain items from only one restaurant.
- Users cannot add food items from multiple restaurants into a single order.

Proposed System

- The proposed system is a Multi-Restaurant Online Food Ordering Website.
- It allows users to browse menus from different restaurants on one platform.
- Users can add food items from multiple restaurants into a single cart.
- The system provides a centralized website where many restaurants are available.
- Customers can explore different food options easily without visiting multiple websites.
- Users can select items from different restaurants and view them together in one cart.

System Architecture

- Web Browser Interface – Users access the platform through a web browser to browse restaurants and order food.
- HTML Structure – HTML is used to organize the website content such as restaurant menus, food items, and navigation sections.
- CSS Design – CSS is used to design the layout, colors, and overall appearance of the website.
- Responsive Interface – The website adapts to different devices like mobile phones, tablets, and desktops.
- JavaScript Interactivity – JavaScript handles actions such as adding items to the cart and updating the cart dynamically.
- User Food Selection – Users can browse multiple restaurants, select food items, and add them to a single cart.

Project Modules

- Home Module – Displays restaurant introduction, logo, navigation menu, and welcome section.
- Menu Module – Shows food categories, menu items, prices, and interactive menu display.
- Gallery Module – Displays images of food items and restaurant ambiance.
- Contact Module – Provides contact details, address, and a contact form for user queries.
- Responsive Design Module – Ensures the website works properly on mobile, tablet, and desktop screens using CSS media queries.

Objectives

- Develop a responsive website that allows users to browse restaurants and order food easily from different devices.
- Provide an interactive user interface using HTML, CSS, and JavaScript for a better user experience.
- Display restaurant menus and food items clearly so users can explore available dishes and prices.
- Enable users to select food items and add them to a cart from multiple restaurants.
- Implement dynamic cart functionality to update selected items before placing the order.
- Ensure responsive design so the website works smoothly on mobiles, tablets, and desktops.

Co’s Attainments - FWD

CO1 Attainment: Internet Fundamentals, HTML & Introductory CSS

Developed the basic structure of the website using HTML including navigation bar, hero section, restaurant listings, and footer.

Applied basic CSS styling for typography, colors, spacing, and layout design.

Implemented responsive webpage structure using viewport settings and organized HTML elements.

CO2 Attainment: HTML Forms, Semantic Tags & CSS Layouts

Designed semantic HTML structure using elements like header, section, nav, and footer.

Implemented search bar and input elements for restaurant search functionality.

Applied advanced CSS layouts such as Flexbox/Grid and media queries to create a responsive interface.

Co’s Attainments - FWD

CO3 Attainment: JavaScript Programming Essentials

Implemented JavaScript logic for filtering restaurants and managing user interactions.

Used arrays and objects to store restaurant and food item data.

Applied functions, conditions, and loops to handle dynamic content and user actions.

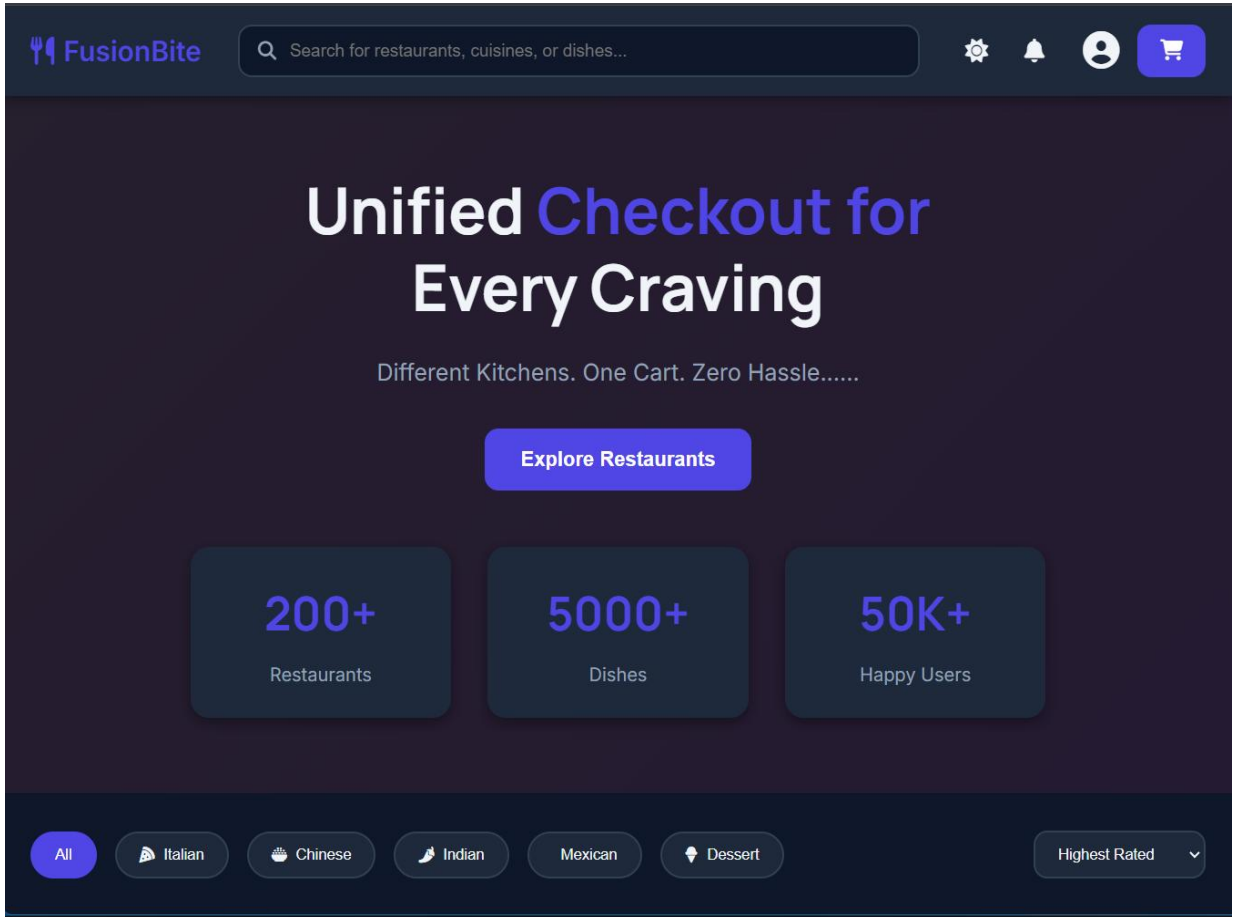
CO4 Attainment: JavaScript Interactivity & DOM

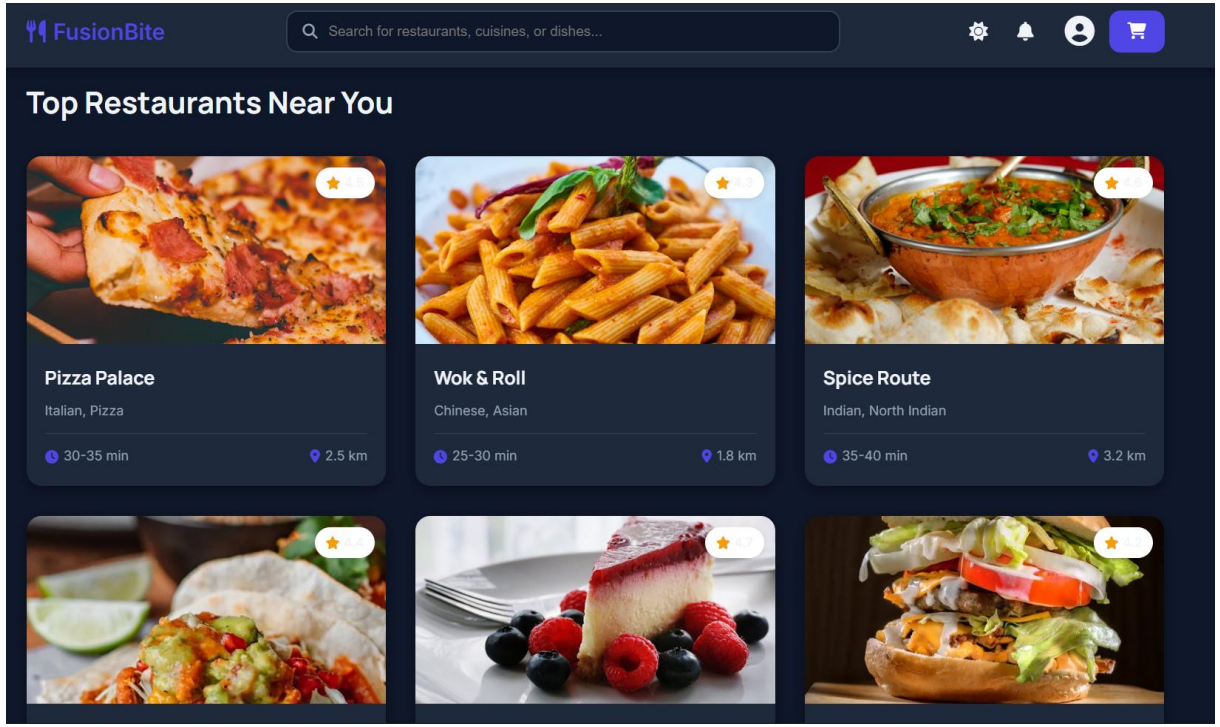
Used DOM manipulation to dynamically display restaurant data and update the interface.

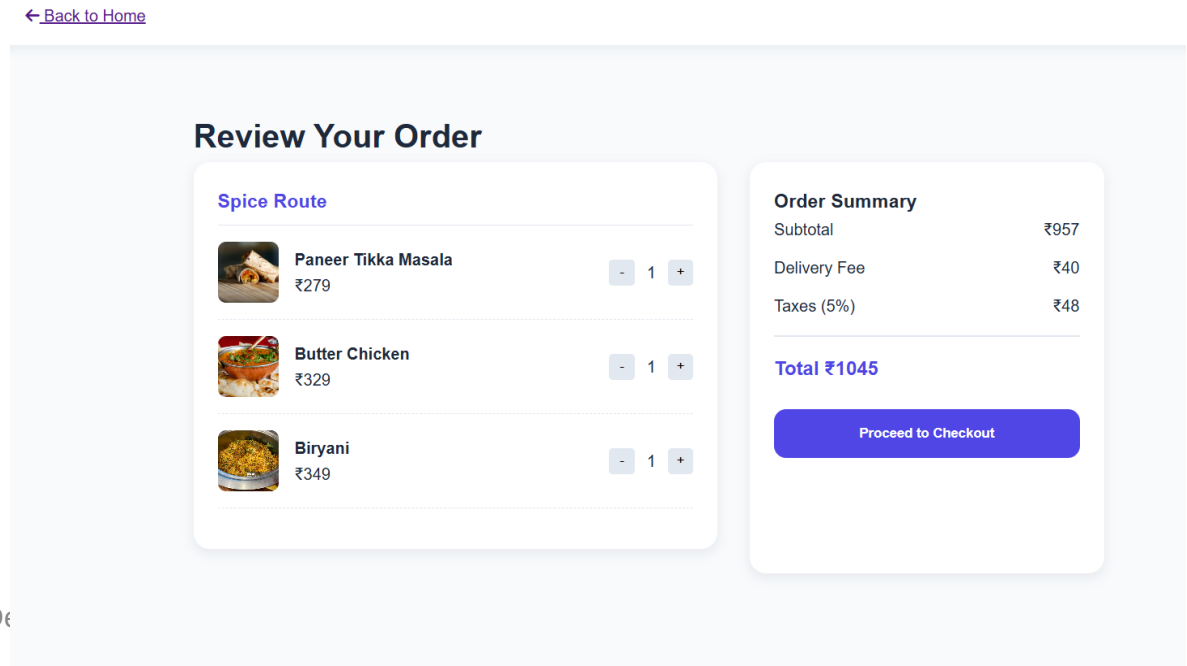
Implemented event handling for buttons such as search, filters, cart, and theme toggle.

Managed cart updates and notifications using JavaScript events.

Screenshots for FWD







Conclusion

The Multi-Restaurant Online Food Ordering Website was successfully developed using HTML, CSS, and JavaScript.

The platform allows users to browse multiple restaurants and select food items easily.

Users can add items from different restaurants into a single cart and review them before placing an order.

Features like search, filters, sorting, and cart management improve the user experience.

The website uses responsive design, making it accessible on mobile, tablet, and desktop devices.

JavaScript interactivity enables dynamic updates, event handling, and smooth user interaction.

Overall, the project demonstrates an efficient and user-friendly online food ordering system using modern web technologies.
